

Otium Utilistor Version 1.5

Release Notes

What's New in Utilistor Version 1.5?

- **DSR Desktop**
This is DSR-Files 'Light' for Desktop and Laptop PC's. It takes a 'current' snapshot of how the storage is being used on a PC. The resulting report graphically displays how much data is stored on the PC, and what that data consists of. This enables the IT Manager to make informed decisions on 'company wide' data protection and management.
- **DSR-Files Scheduled Reports**
All DSR reports can now be scheduled to run at a pre-defined time, and automatically reschedule themselves to run at regular periods.
- **DSR-Files Volume Drill-Down**
It is now possible to run a DSR report against a single volume, or to exclude one or more volumes from a report!
- **DSR-Files Report Generation Status**
Utilistor now makes it possible to see if a report is being generated.
- **Scheduler Status**
The current status of scheduled jobs is now displayed within the Scheduler tab of the Utilistor Dashboard
- **DSM Threshold Setting**
Enhancements have been made to the Dashboard to allow the same threshold to be applied to all Volumes on a particular client. The mechanism for selecting the clients has also been changed to a pull-down list of volumes.
- **I/O Values in DSM Tables Tab**
The last recorded I/O value for a monitored volume is now displayed on the DSM Tables Tab of the Utilistor Dashboard
- **Client Status Display**
The Dashboard now displays the connection status of each Utilistor Client.
- **Dashboard Refresh**
All views within the Utilistor Dashboard now auto-refresh. The refresh rate defaults to 30 seconds and is controlled by a setting within the Customize Menu.
- **Enhanced Data Collection Methods**
The DSR-Files Data collector has been enhanced to reduce the amount of memory, cpu, and network bandwidth that is required to scan 'massive' file servers. Version 1.5 has been tested on File Servers within in excess of 5 Million Files.
- **Enhanced Support for NAS and Network Shares**
The Utilistor Client installation script now allows you to define which account the client service will use to collect the data. This facilitates effective data collection from Network Attached Drives (e.g. NAS Servers).
- **Log File Maintenance**
Utilistor will close all log files at midnight and start writing to a new version. The old file is renamed and saved for 24 hours.
- **Utilistor Supported on Windows NT4**
Version 1.5 of Utilistor now supports the client running on NT4.
- **Utilistor Dashboard Desktop Shortcut**
The installation of the Utilistor Dashboard now places a short-cut on the Windows Desktop.

**For more information please refer to the
Utilistor Version 1.5 Administration Guide.**
